

Chronic Space Concept Model

Concept model for the proposed Chronic Space within Impilo, showing the workspace structure, care flow, and information exchange required to support integrated chronic care.

PATIENT
[Name] | [Patient ID]

CARE CONTEXT
Chronic Care Encounter

ACTIVE CHRONIC CONDITIONS
HIV HTN Diabetes

CURRENT RISK / ATTENTION FLAGS
Overdue High BP

Whole Patient View

First screen context

Active conditionsCondition countPrevious visitsRisks

Relevant History

Previous decisions
Last clinical decision carried forward into today's encounter.

Prior referrals
Referral made, referral outcome, or pending feedback.

Recent results
Relevant investigations and trends for decision-making.

Alerts / Prompts

Missed reviewDue screeningUncontrolled BPMedicine issue

Today's Chronic Encounter

Single coordinated encounter

Visit reason / entry point
Refill, review, new complaint, follow-up, tracing, or routine chronic care visit.

Single entry vitals
BP, weight, temperature, and other required observations captured once and reused.

Clinical review
Symptoms, assessment, diagnoses, medicines, treatment decision, and care plan.

Care plan update
Continue, adjust, refer, investigate, counsel, schedule follow-up, or trigger tracing.

Algorithm Support / Decision Guidance

Guided diagnosis
Example: elevated BP pathway before confirmed hypertension diagnosis.

Due screenings
AHD, diabetes, mental health, or other condition/risk prompts.

Safety checks
Contraindications, polypharmacy, missed care opportunities, and abnormal value alerts.

Current Medicines

Across conditions
ART, BP medicines, diabetes medicines, and other chronic medicines in one view.

Dispensing history
Last dispensed date, quantity, and refill duration.

Continuity risk
Stock issue, missed refill, or medicine change requiring attention.

Appointments / Follow-up

Next review date
Clinical review date.

Next refill date
Medicine refill date.

Alignment
Shared appointment/refill date where clinically appropriate.

Overdue list
Missed review or missed refill requiring follow-up.

Longitudinal Timeline / Patient Journey Record

Today

Check-in → vitals → chronic encounter → medicines → appointment/refill planning → follow-up actions.

Previous visit

Last BP, symptoms, medicines, decisions, counselling, and next steps carried forward.

Referral

Referral made, service point, expected feedback, outcome received or pending.

Chronic Care Flow Supported by the Workspace

This flow shows how the Chronic Space concept supports one coordinated chronic care encounter, from patient identification through review, medicines, follow-up, and continuity.

1. Patient Identified

- Patient record is opened.
- Chronic status and active conditions become visible.
- System should not rely only on the presenting reason for today's visit.

2. Chronic Space Opens

- Whole-patient summary displayed.
- Relevant previous decisions, medicines, appointments, results, and risks surfaced.
- Healthcare worker sees the patient as one person with multiple needs.

3. Vitals / Initial Assessment

- Vitals captured once.
- Abnormal values flagged.
- Due screenings or missing observations prompted before decisions are made.

4. Clinical Review

- Complaints, conditions, current medicines, and prior history reviewed.
- Algorithms or prompts support guideline-consistent care.
- Multiple chronic conditions can be handled in one encounter.

5. Care Decision / Plan

- Treatment continued, adjusted, referred, or investigated.
- Counselling and education recorded where required.
- Care plan is carried forward for continuity.

6. Medicines / Refill Planning

- Current medicines reviewed across all chronic conditions.
- Refill duration recorded.
- Medicine continuity risks surfaced where relevant.

7. Appointment / Follow-up Planning

- Review and refill dates aligned where appropriate.
- Missed review or overdue status updated.
- Tracing or follow-up actions generated where needed.

8. Encounter Closed

- Encounter summary saved.
- Updated chronic state becomes visible to the next user.
- Data supports both programme reporting and person-level chronic care view.

Information Exchange With Other Impilo Workspaces

The Chronic Space should surface the information needed for integrated chronic care without duplicating every workspace. It should also write back the chronic care state needed for continuity, follow-up, and reporting.

Proposed Chronic Space Components

These components translate the co-produced design logic into visible workspace areas for product, clinical, and technical review.

1. Whole Patient View

Shows the patient as one person with multiple chronic conditions.

- Active chronic conditions
- Condition count / multimorbidity flag
- Key history and risks

2. Smart Clinical Encounter

Supports one encounter covering multiple chronic care needs.

- Single encounter note
- Clinical review
- Care plan update

3. Capture Once, Use Many Times

Reduces duplicate capture and supports reuse across workflows.

- Single entry vitals
- Reusable consultation note
- Structured chronic data fields

4. Clinical Decision Support

Prompts users where chronic care algorithms require action.

- Abnormal value alerts
- Due screening prompts
- Guided diagnosis pathways

5. Coordinated Follow-up

Aligns review, refill, and tracing activity around the patient.

- Unified appointments
- Refill alignment
- Overdue and missed visit lists

6. Medicines Continuity

Surfaces medicine history and refill continuity risks.

- Current medicines
- Dispensing history
- Stock / refill issues

7. Reporting & Intelligence

Preserves programme reporting while adding person-level chronic care visibility.

- HIV / NCD programme outputs
- Person-level multimorbidity counts
- Cohort queries

8. Governance & Privacy

Controls who sees and edits sensitive information.

- Role-based access
- Audit trail
- Controlled displays

9. Low-Resource Reliability

Supports realistic primary-care operating conditions.

- Offline capture and sync
- Fast screens
- Shared-device workflow
